

Cybersecurity Internship

Cybersecurity Internship — Maincrafts Technology

Intern: Benidict David

Lab-based cybersecurity internship work — building intentionally vulnerable environments and assessing them with industry-standard tooling.

Task 2 — Lab Build

Date: 27 June 2026

Built a personal cybersecurity lab using Oracle VirtualBox + Kali Linux + OWASP Juice Shop (Docker). Tools validated: Nmap, Wireshark, Burp Suite.

File: [Task-2/Benidict_David_Task2_Lab_Report.pdf](#)

Tools: Oracle VirtualBox 7.x · Kali Linux 2026.1 · OWASP Juice Shop (Docker) · Nmap 7.99 · Wireshark · Burp Suite Community Edition

Network: NAT adapter for internet access (10.0.2.0/24) · Host-Only adapter for isolated lab traffic (192.168.56.0/24)

Task 3 — Vulnerability Scanning & Assessment

Date: 7 July 2026

Performed a vulnerability assessment against Metasploitable2 (192.168.56.103) and OWASP Juice Shop (Docker, port 3000), using Nmap, Nikto, and Dirsearch for host discovery, port/service enumeration, and web-layer scanning. Identification and documentation only — no exploitation, per task scope.

File: [Task-3/VAR_Task3_Benidict.pdf](#)

Tools: Nmap 7.99 · Nikto v2.6.0 · Dirsearch v0.4.3

Key findings: - Metasploitable2 — backdoored vsftpd 2.3.4 (CVE-2011-2523) and UnrealIRCd (CVE-2010-2075), default Tomcat Manager credentials, cleartext r-services (rsh/rlogin/rexec) - Juice Shop — wildcard CORS policy, missing HSTS/CSP headers, no rate limiting (directory brute-forcing at default thread count reproducibly degraded the service)

Full risk ratings, impact analysis, and remediation are in the PDF.
